### LUINULLU

DESCRIPTION OF ACCIDENT

### dirief narrative of Accident. Include statement of responsibility and recommendations for action to prevent repatition)

The pilot has made a normal appears and landing speed was normal. The flare out was a trifle late, but the ship did not bounce. Loft landing gear drag link pivot was pulled out of appears breaking drag link pivot shaft.ef front of main landing gear ivet shaft where the two shafts acrew together. Main landing gear cleo lag was sheared off at top of cleo cylinder, shout one half of the break occurred in the area of the lower thread, the rest of the break was on the forward area of strut cylinder with the all being pulled sport. Freek would didicts that failure was due to a sheare load on landing gear, there was no indication; of excessive compression load as sing spors at front and back of main landing gear pivot haft housing showed no signs of sheared rivets or buckling. Airplane fuscing was bably damaged between stations ho 2 and No.7, fuscing was also twisted at front of borizontal subligar.

The pilot may have made a harder than now holdshill stabilizer, that it sequences in the set of facilities available for a quick testing of sheared olro cylinder, and no fair degree of responsibility can be played because of those conditions.

IMMEDIATE CAUSE-	left oleo cylinder ab be damaged beyond repair	ceared on landing c	
UNDERLYING CAUSE-	Probably a combination making a harder than nor	on of material fail mal landing.	ure'and pilot
RESPONSIBILITY-	100% Unknown.		
RECOMPENDATIONS :	None.	A dan w	1

### RESTRICTED

#### PILO"'S STATEMENT ON ACCIDENT IN AIRPLANE 42-95216

On third landing after a very good approach (constant strapesd 130MPM), a lover than normal flar-out (Approximately 110 MPH), and actual contact with runway which was a trifle hard due to late flare-out (plane landed solidly on the two men wheels) the plane stored a normal landing roll.

After about 50 ft., the left londing gear began to shear off giving me the impression of a blown time. I was able to keep the plane under control until the wing frommed causing a shear burn to the left, off the nunway.

A, this time the engineer shot red flares and turned the fuel cocks off. Instructor milot turned switches off and ship was abandoned with no injury to nerronnel.

It is my orinion that the accident was due to structural failure.

. .

Denald A. Montporrency DONALD A. MONTGOMENT.

DONALD A. MONTGOMERY 1st Lt, AC, Pilot.

## RESTRICTED

#### INSTRUCTOR PILOT'S STATEMENT ON ACCIDENT IN AIRPLANE 42-95216

We had mraviously what two landings, the first one normal and the second a little hard but not enough to damage the landing genr. On the third landing the annroad was normal and very good. Landing stitude was normal and the inse wheel was definitely off the ground when the ship hit. Ship did hit ouite hard.

The left gear did not seem to shear completely off on impact as we had feirly wood control until it collapsed completely and the wing struck the runway, throwing the shin to the laft.

To all appearances, I would say that we hit the runway about 70-80 feet from the end and in a wing level attitude.

> WILLIAM E SLOAN, 2nd Lt, AC, Instructor Pilot.

William C. Sland

6 MAY 1945

### ACCIDENT STATEMENT

AAF 125 APO 558

AT 23:00 HOURS B-21, 216-K, 753RD SQDN, PILOT LT. 1941-BOWERY, BROKE LEFT STRUT OF MAIN GEAR UPON LANDING. LEFT GEAR COLLAPSED AND AIRCRAFT RAN OFF RUNWAY ONTO GRASS. HOME OF THE CREW WERE INJURED. AIRCRAFT SUSTAINED EXTENSIVE DAMAGE AND WILL IN SALVAGED.

WEATHER: VIZ. 6 MILES; WIND, SW AT 6 MILES PER HOUR.

DESSE (NMI) HALPERN 1ST LT., AIR CORPS FLYING CONTROL OFFICER

# RESTRICTED

ENGINEER'S STATEMENT ON ACCIDENT IN AIRPLANE 42-95216

On landing I was calling out the airspeed, and when we hit the runway the indicator read 110.

I couldn't tell if we landed on one wheel or not, but it felt like we coming in level. We rolled along normally until the landing gear gabe way and we went down on one wing.

/Set Joseph K. Driggs. 35869701.
